

It Just Works!

The POS System that gets the job done

Electronic Payments onePAY Table Side Payments

As the world changes to a cashless society, you need to ensure that your point of sale system can process all forms of electronic payments to stay competitive in the market. Payment Processing is an integral part of the onePOS system and was designed as part of the overall solution. It contains the features you need, both now and in the future, while maintaining the simplicity of operation you expect from onePOS.

EMV + Mobile Payments

onePOS supports all of the latest standards in payments including EMV, NFC, deferred processing and more. Several options exist to let you affordably take payment at counter, bar, or table side using onePAY payment devices. These processing handheld and tablet devices provide an affordable solution that allows a server to pull up a check, select the guests and securely take payment in front of the guest.

Easy to Train

onePOS PCI compliant and PA-DSS validated payment processing is part of the overall system eliminating additional training as all features are just a natural part of using the software. For instance, dipping a credit card at a POS terminal while a guest check is displayed on the screen automatically approves that card and closes the check. You can ring up a beer and close it to a credit card in a single touch.

Tools to Manage Effectively

Fraud prevention is built in to the solution. Manager overrides can be required when keying in card numbers, performing forced authorizations, voiding transactions, issuing a credit, or changing a tip amount. The electronic payment irregularity report shows you duplicate card numbers, excessive tips, and manually keyed transactions for further control.

Batches automatically update system totals and appear on the daily sales report, ensuring reporting accuracy and providing a true over/short.

Impress your Guests - onePAY

using onePAY – our mobile table side payment solution – your servers can access guest checks, print or email receipts, and take EMV payments. Guests can select tips and enter their card PINs right on the touchscreen.

Gift Cards

Support for onePOS' own multi-unit oneMetrix gift cards, as well as from a variety of other processors, provides an easy solution for flexible payments, promotions, special events, and employee incentives. oneMetrix gift card payment transactions can be performed online off-site, further increasing the system's flexibility.

House Accounts

oneMetrix house accounts allows tracking the spending for customers and businesses at your locations and generating statements on demand for payment. Like oneMetrix gift cards, house account payment transactions can be performed online off-site, further increasing the system's flexibility.

Highlighted Features

- Support for high speed processing via the Internet. Cable modem, DSL, and backup via cellular LTE.
- Full support for credit card transactions; including sales, credits, voids, tips, and end of day batching.
- Full support for gift cards; including sale, add value, balance query, credits, voids, tips, and end of day batching.
- Supports onePOS' multi-unit web-based gift cards.
- All actions which effect an electronic payment happen automatically, such as tip adjustments, voids, and credits.
- Automatic updating of POS system totals reduces errors.
- Manager access can be required to authorize approval of manual transactions, cards which do not scan, force authorize transactions, or re-tip a card.
- Certified with major leading financial processors... new processors are added all the time.
- PA-DSS Validated to ensure your security.
- Batch summary report makes reconciling statements simple.
