

It Just Works!

The POS System that gets the job done

Online Ordering

onePOS Online Ordering is offered as an in-house solution to process customer orders online.

This solution provides a means to customize the appearance of the web page based on the your needs. Each location can be configured to have a different user experience. So if you own several locations each Online ordering page can look completely unique. The onePOS Online Ordering solution provides simple and quick set up, and you can control the user experience to meet what is best for your restaurants.

POS Integration

Once orders are placed a ticket at the store is automatically created and the items can be printed in the kitchen as if they were ordered in the store, including complex print routing, consolidation, and timings. Save time and increase server productivity eliminating the need to rekey orders from a fax or iPad into the POS once the order is received.

Flexible Payment Options

Various payment processing methods can be configured using onePOS Online Ordering. Pay with cash, at the store, with or with a credit card. You can also require payment online and not at the store to prevent fraudulent orders. onePOS Online Ordering allows you to choose how you want your customers to pay for their orders.

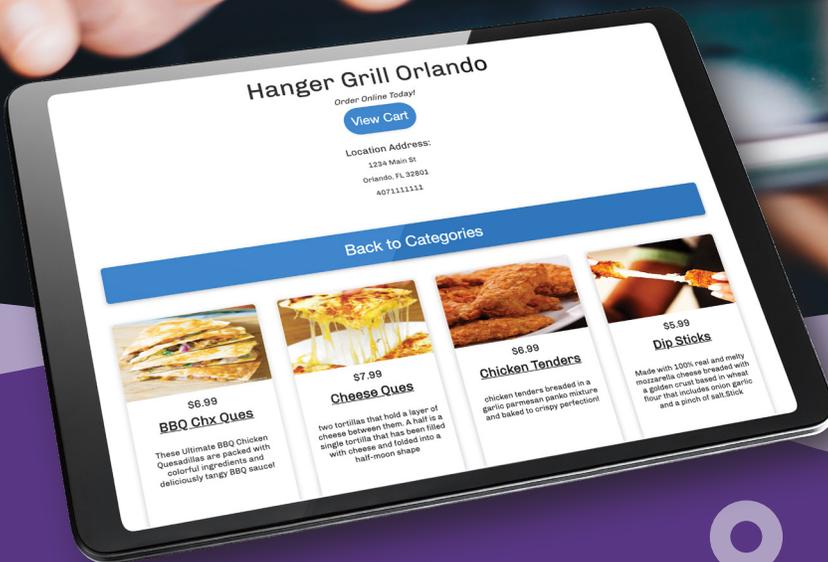

User Friendly

Online customers can join the onePOS loyalty program and log into their existing onePOS loyalty accounts when placing orders online. When ordering, customers can easily duplicate and edit items

already in their carts. The web page is very user-friendly for the customers, and the same link to the web page works on any mobile device browser scaled to device size.

Fast and Accurate to Use

Online ordering screens and menu items are set up simply using the onePOS hybrid cloud solution. Once this is configured, the Online Ordering screens and menu items can be set up as well. Both menu items and screens contain online ordering properties that are defined by location; these include a specific name and description for each item, the order in which it will show on the web site, and if it is a featured item to encourage customers to purchase the item. Users can also enforce a charge on particular side item or on a number of side items or toppings. The system can therefore easily be used to set up screens and menu items for various types of restaurants like pizza places, high-end restaurants or sandwich shops.

Highlighted Features
